

Getting your chatbot ready to go live

A quick reference for what you need to do, and what our team takes care of for you — so your AI chatbot can start answering customers as fast as possible.

Congrats on creating your chatbot! 🎉 It's private and offline for now — it only starts answering real customers once you've added your content and connected the channels you want it on. This guide walks through exactly what happens next, and who's responsible for each step.

✓ What you'll do — no technical skills needed

Just information about your own business. Everything below lives in your chatbot's dashboard.

1 Overview tab — basic details

Your bot's name, a short description, its "persona" (how it should sound — friendly, professional, etc.), and which language(s) it should reply in.

2 Knowledge Base tab — your content

This is what your bot actually answers from: menu items and prices, opening hours, booking policies, FAQs — whatever your customers usually ask. No knowledge base means every reply falls back to a generic message, so this is the most important step.

3 Your OpenAI API key

Your chatbot needs its own OpenAI key to think and reply intelligently — this keeps your usage and billing completely separate from every other client on LogicMate. Create a free account at platform.openai.com, generate a key, and paste it in when the dashboard prompts you. Not comfortable doing this yourself? Just email us the key and we'll add it for you.

🔧 What our team handles for you

These steps involve third-party platforms (Meta/Facebook) with real technical setup — we take care of this so you don't have to.

1 WhatsApp connection

Connecting your chatbot to WhatsApp requires setting up a Meta Business App and generating secure access credentials — a technical process on Meta's platform. Just reply to your welcome email with the WhatsApp number you'd like connected, and we'll handle the entire setup.

2 Instagram connection

Same idea as WhatsApp — tell us the Instagram account you'd like connected and we'll take care of the Meta setup. Note: Instagram DM automation also requires a review from Meta before it goes fully live, which can take a few days on their end.

i Website widget — the easy one

Unlike WhatsApp/Instagram, adding your chatbot to your own website needs no Meta account at all — just enable it in the Channels tab and copy the ready-made code snippet onto your site. You're welcome to do this yourself, or ask us to.

Need anything at all? Reply to your welcome email or write to hello@logicmate.io — we're happy to set up as much or as little as you'd like.

Tip: You can find this exact guide anytime — no need to save this PDF — under the **"Guide to Setup"** tab inside your chatbot's dashboard.
