

Getting your chatbot ready to go live

A quick reference for what you need to do, what our team can help with, and a full tour of every tab in your dashboard.

Congrats on creating your chatbot! 🎉 It's private and offline for now — it only starts answering real customers once you've added your content and connected the channels you want it on. This guide walks through exactly what happens next, tab by tab.

✓ What you'll do — no technical skills needed

Just information about your own business. Everything below lives in your chatbot's dashboard.

1 Overview tab — basic details

Your bot's name, a short description, its "persona" (how it should sound), and which language(s) it should reply in.

2 Knowledge Base tab — your content

This is what your bot actually answers from: menu items and prices, opening hours, booking policies, FAQs — whatever your customers usually ask. No knowledge base means every reply falls back to a generic message, so this is the most important step.

3 Your OpenAI API key

Your chatbot needs its own OpenAI key to think and reply — this keeps your usage and billing completely separate from every other client. Create a free account at platform.openai.com, generate a key, and paste it in when the dashboard prompts you. Not comfortable doing this yourself? Just email us the key and we'll add it for you.

🗉 What each tab does

A quick tour of everything in your dashboard, tab by tab.

1 Overview — your bot's identity

Name, description, persona, reply language(s), and the fallback message it sends when it doesn't know an answer (in English and Arabic). The status switch (draft / active / inactive) controls whether it's actually live — going live requires a verified email on the account. There's also an optional Booking Link (e.g. Calendly, OpenTable): set it and the bot shares that link whenever someone wants to book; leave it blank and the bot collects their name, phone and email instead.

2 Knowledge Base — what it's allowed to answer

Add entries as FAQs, plain text, or a URL to pull from. The bot only ever answers from what's here — nothing outside this list, beyond the fallback message.

3 Channels — where customers can reach it

The Website widget needs no Meta account at all — enable it and copy a ready-made code snippet onto your site. WhatsApp and Instagram are included from the Pro plan and up — see "Connecting WhatsApp & Instagram" below for how that setup works.

4 **Conversations — real chats, with leads pinned**

Every conversation your bot has, expandable into the full back-and-forth. The moment a customer shares their name, phone, or email, it's automatically pinned to the top of that conversation with a ⓘ Lead badge, plus one-tap WhatsApp/email links — so following up never means re-reading a whole transcript.

5 **Analytics — how the bot is performing**

Included from the Pro plan and up: total conversations, total messages, a breakdown by channel, and how often a chat needed a human handoff.

6 **Billing — plan, trial and payments**

Your current tier and trial countdown, plus payment history. If a payment is due, you'll see bank details and a simple "I've paid" form right here.

Connecting WhatsApp & Instagram

Included from the Pro plan and up. Both need a real Meta Business App behind them — there are two ways to get there, pick whichever's easier for you:

A

Option A — set up your own Meta Business (recommended)

You create a free Meta Business Portfolio and app under your own business, then grant our team Partner/Admin access — never your password, and you can revoke it any time from the same screen. We then configure WhatsApp and Instagram inside your own app and hand the credentials back for your Channels tab. This keeps your setup entirely your own, with no shared limits from anyone else's account.

B

Option B — we handle the whole thing for you

Not comfortable with Option A? Reply to your welcome email or write to hello@logicmate.io — we'll do the entire Meta setup for you on a call, under our own account. All we need from you is the WhatsApp number and Instagram account you'd like connected.

i

Instagram takes a bit longer either way

Instagram DM automation additionally needs a review from Meta before it goes fully live — typically a few days, on Meta's side, not something either setup path can speed up.

i

Website widget — the easy one, on every plan

Unlike WhatsApp/Instagram, adding your chatbot to your own website needs no Meta account at all — just enable it in the Channels tab and copy the ready-made code snippet onto your site. You're welcome to do this yourself, or ask us to.

Need anything at all?

Reply to your welcome email or write to hello@logicmate.io — we're happy to set up as much or as little as you'd like, including either Meta setup option above.

Tip: You can find this exact guide anytime — no need to save this PDF — under the "Guide to Setup" tab inside your chatbot's dashboard, which is always up to date with your bot's actual plan.
